

✓ **Researchers have discovered the average age of onset for MS—when people get diagnosed with multiple sclerosis—has been steadily increasing since the 1990s. Why?**

- More sensitive and thorough diagnostics testing
- Neurologists are more aware and knowledgeable of the disease
- Improvements specifically in MRI technology
- The internet age has resulted in better informed, proactive patients
- All of the above
- None of the above
- The age of onset is not significantly increasing ✓

Feedback

*Booya! Researchers have watched the average age of MS onset inexplicably increase over the last 30 years, from 29 years of age rising to 34, a startling difference of 5 years. But Part III of *Sit Down Before Reading* will reveal surprising evidence that the age of onset for the disease remains relatively unchanged.*
